

## Collaboration Discussion -2

### Peer-Response

Hello Ashok, Thanks for the great post!

Both the BCS (2022) and ACM (2018) Codes of Conduct emphasize the need for all members of the computing community to act with honesty, integrity, and responsibility.

Abi should always be truthful and open with others. It is immoral to knowingly misrepresent or omit data about the effectiveness of a product or system. Instead, he needs to give real information, even if it is unfavorable to the product, in order to be taken seriously. Consequences and loss of trust might result from intentionally misleading the public.

Abi needs to safeguard the authenticity of the information he handles. According to the ACM Code of Ethics, it is wrong to lie or manipulate data in any way. Therefore, it is crucial for Abi to protect the honesty of her data and prevent its modification in any way.

Abi needs to be cautious of being swayed or pressured by clients to alter data in a predetermined way. He must avoid being influenced by others in his field and fight off any attempts to manipulate his findings. It is essential that he works in accordance with the highest ethical standards.

In conclusion, Abi needs to put ethics first in his profession by being honest and open about the information he deals with and provides. If he takes this advice to heart, he will help increase public confidence in IT workers and the goods and services they provide.

Dear Iason, Thanks for the great post!

Abi is right in his assessment that manipulating the study's data values would be immoral. This is consistent with long-standing norms of research ethics, which stress the importance of being truthful and transparent with data.

It's unethical to recommend conducting separate analyses to back up competing hypotheses. Researchers have an obligation to report their findings objectively and provide a whole picture, whatever the ramifications may be. Abi should think again about taking this approach.

Abi must take full accountability for how the outcomes of his programme are put to use. He must make sure the manufacturer is aware of any ethical considerations or constraints. Ethical cooperation relies on open and honest dialogue between everyone involved.

Abi is right to be concerned that the company will only highlight the favorable findings. He needs to talk to the manufacturer about his issues and see what can be done about them. Abi may want to bring in a third party to verify the statistics if the manufacturer insists on selective reporting.
